

Republic Metals has been a leader in lead anode manufacturing since 1924, producing the highest-quality anodes in the industry.

Our lead anodes and related products are the ultimate in design and efficiency. Continuous innovations in design and production standards have enabled us to maintain quality while holding down prices. Our special alloys and purity-controlled extrusion methods create the most efficient anodes on the market today. We use an exclusive nonmetallic flux to create a virtually perfect bond that outperforms conventionally cast anodes.

Our anodes can be furnished in various shapes and sizes, and every order is fabricated to customer specifications. In addition, we offer lead linings, lead coils, conforming lead anodes, a variety of solder anodes, and our "grid" material, which is available in many alloys and fabricated shapes.

Our refining process also offers customers the opportunity to convert used or scrap anodes into new anodes. This affords customers a considerable savings, while at the same time guaranteeing quality control.
